

Small LULC errors can have a substantial effect on watershed model output. LUU Uncertainty enables the user to integrate LULC realizations in the SWAT model and evaluate the sensitivity of SWAT output to LULC errors.

LUU Uncertainty

User Manual

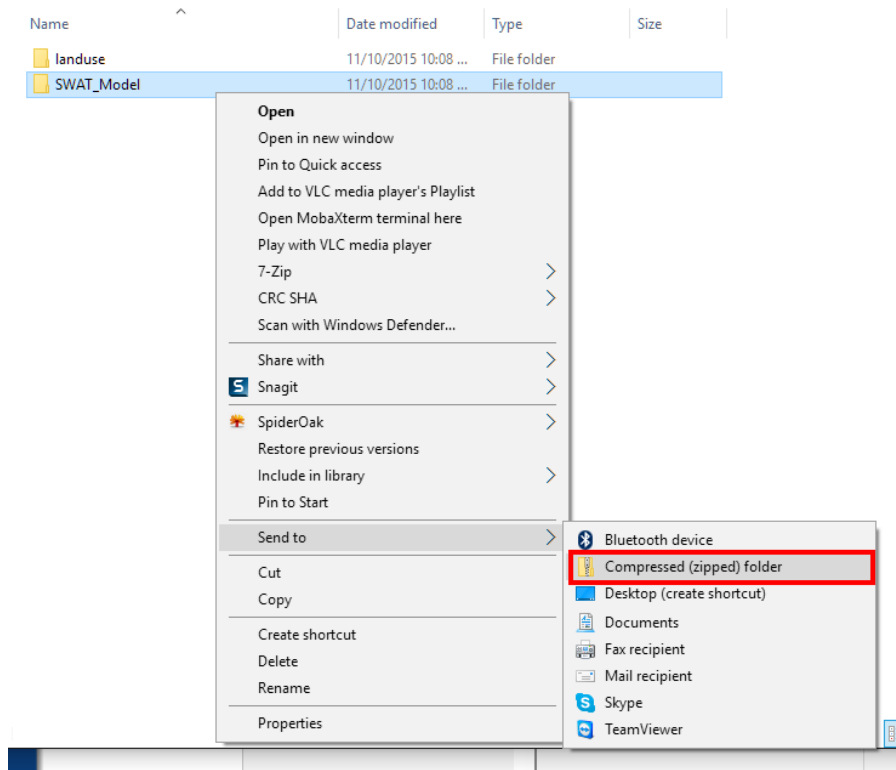

Last Revised: 05/17/2016

Step 1 – SWAT Model Input

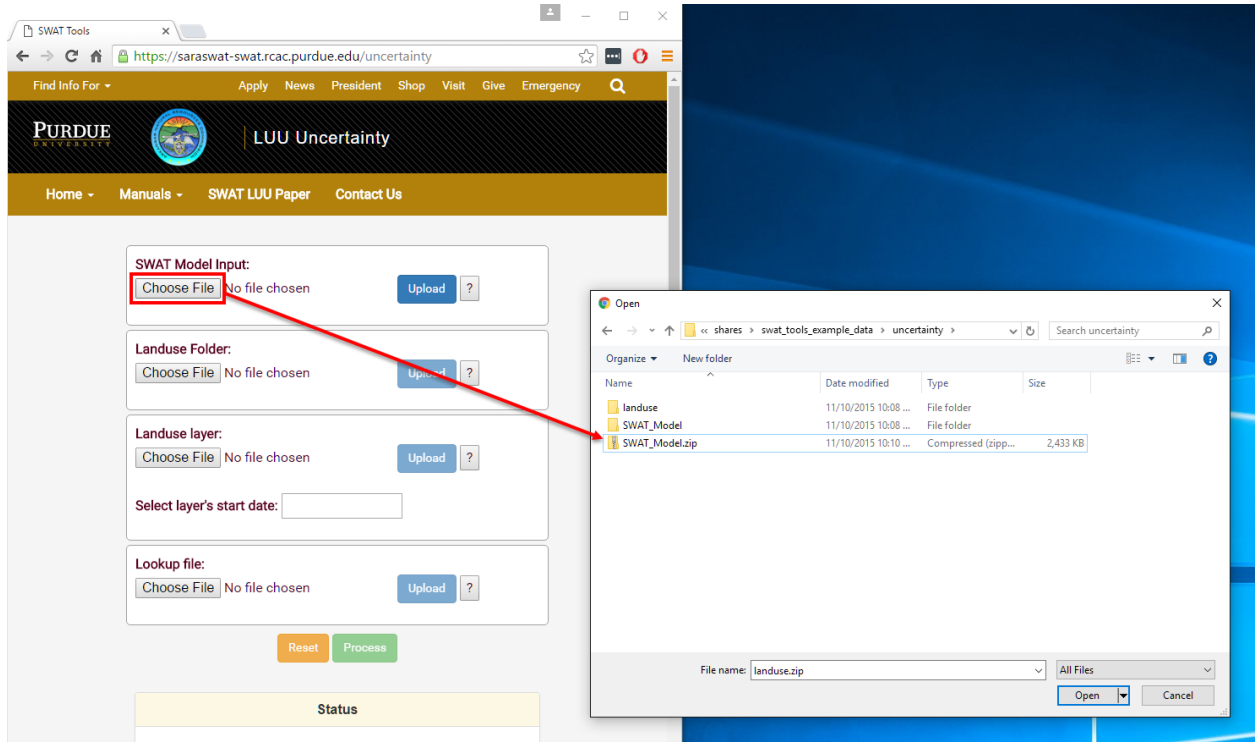

1. The first file you will need to upload is a zipped copy of your SWAT model. The zipfile should be provided with the same name as the directory containing the SWAT model. For example, if your SWAT model is in a directory named “SWAT_Model”, the zipfile should be named “SWAT_Model.zip.” It is necessary that the SWAT model directory has the “Scenarios” and “Watershed” sub-directories and that those two directories contain all of their associated sub-directories and files. The next step will demo how to create a zipfile.

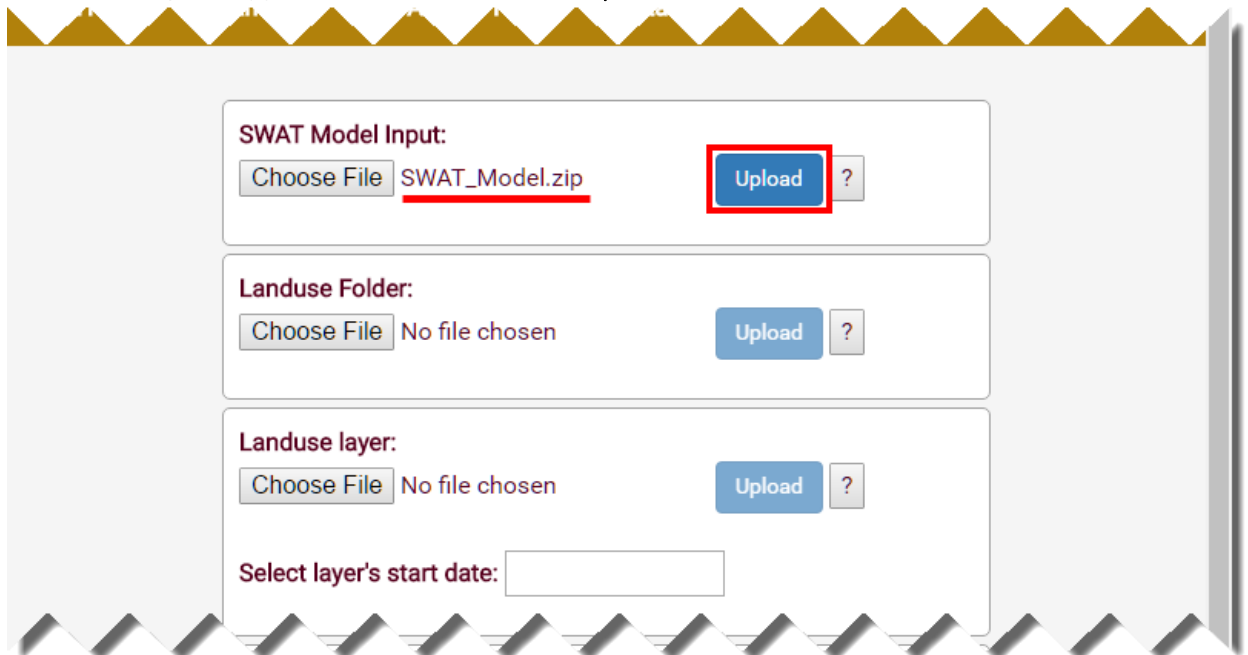

2. Make sure your SWAT model directory matches the above requirements. You can use any software you like to create the zipfile. In Windows 7 and up, you can simply right-click the directory and then select **Send to -> Compressed (zipped) folder** in the menu that appears. The zipfile name should match the SWAT model directory name.

- Click the **Choose File** button in the **SWAT Model Input** section to start the process of uploading your zipped SWAT model. Navigate to the location of your zipped SWAT model and double-click it, or click it once and click the **Open** button.

- After selecting the zipped SWAT model, click the **Upload** button.

- The speed it takes to upload and unzip the file will be dependent on the transfer speed and the size of the file. A green checkmark will appear when the upload has successfully finished.

SWAT Model Input:

No file chosen

☒

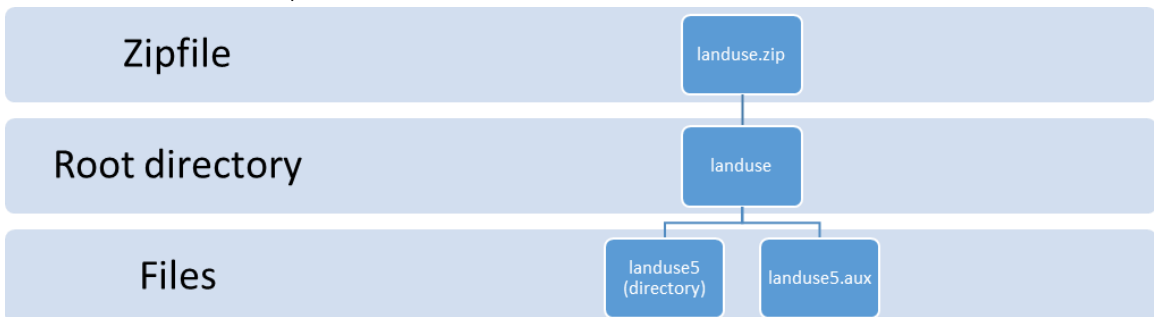

The **Status** frame located at the bottom of the page will be updated with relevant information as you use the tool. If there had been a problem with the shapefile, a message would have appeared in the **Status** frame informing you of the issue.

Status

Swat Model zip folder uploaded.

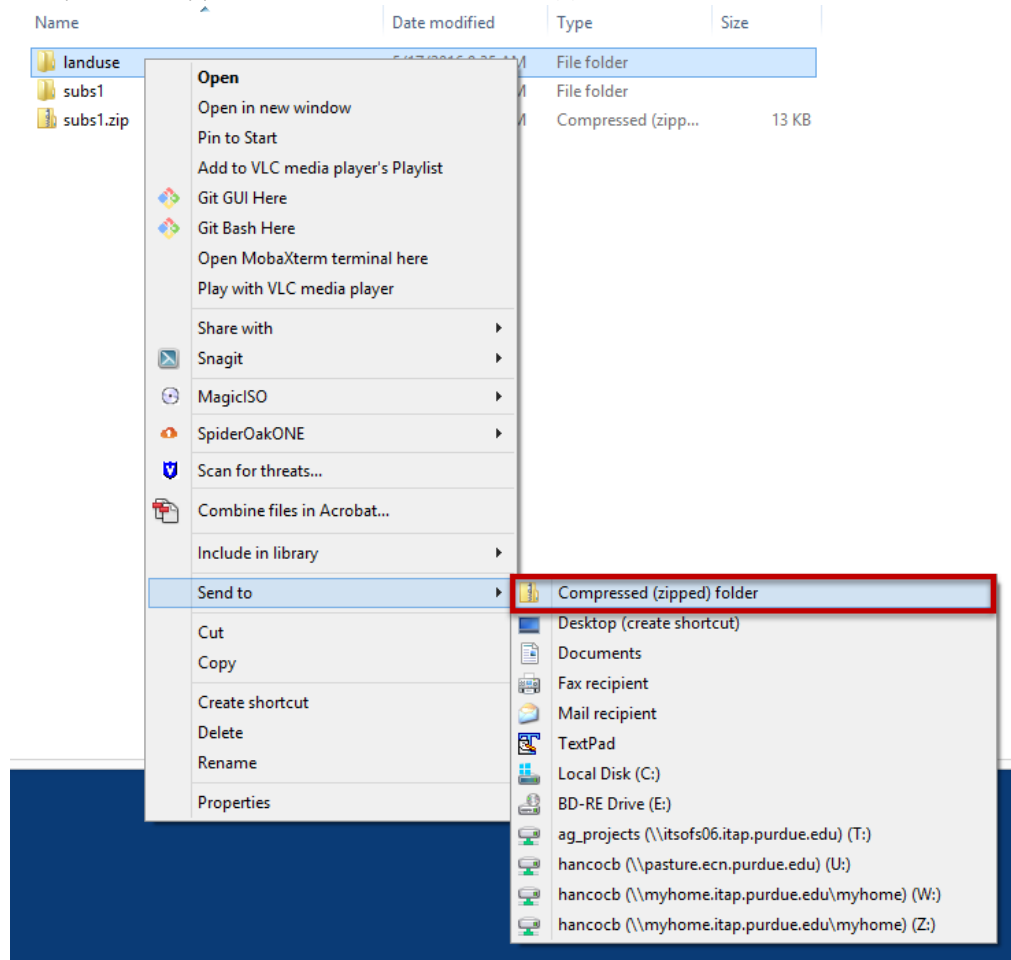

Step 2 – Upload landuse folder

- The **Landuse Folder** section will be activated after you have completed step 1. You will need to provide your landuse data in a zipfile. The zipfile should have a root directory that contains only the landuse data you are interested in analyzing. For example, if you have a 2005 landuse layer named “landuse5 you would need to include the “landuse5” directory as well as the corresponding “.aux” file. These files should be placed into the same directory. The next step will demo how to create a zipfile.

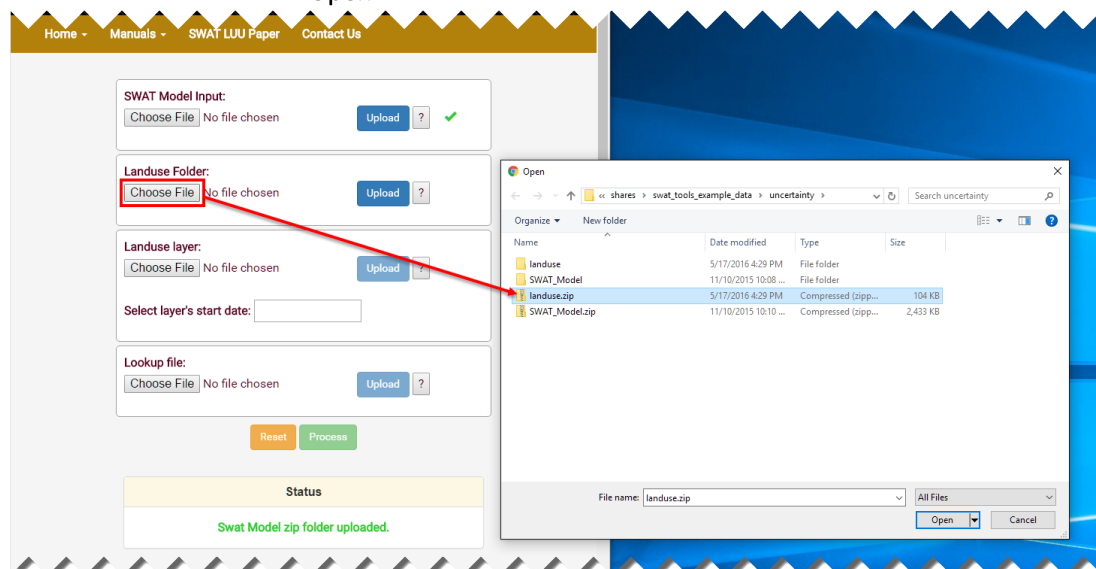

- Once you have placed your landuse data into a common directory, you will need to zip that directory. You can use any software you like to create the zip file. In Windows 7 and up, you can simply right-click the directory containing the landuse data and then select **Send to ->**

Compressed (zipped) folder in the menu that appears.

3. Click the **Choose File** button in the **Landuse Folder** section to start the process of uploading your zipped landuse data. Navigate to the location of your zipped landuse data and double-click it, or click it once and click the **Open** button.

- After selecting the zipped landuse file, click the **Upload** button.

The screenshot shows a web interface for SWAT Model Input. It contains four sections: 'SWAT Model Input:', 'Landuse Folder:', 'Landuse layer:', and 'Lookup file:'. Each section has a 'Choose File' button, a status indicator, and an 'Upload' button. In the 'Landuse Folder:' section, the file 'landuse.zip' is selected, and the 'Upload' button is highlighted with a red box. A green checkmark is visible next to the 'Upload' button in the 'SWAT Model Input:' section.

- The speed it takes to upload and unzip the file will be dependent on the transfer speed and the size of the file. A green checkmark will appear when the upload has successfully finished.

This close-up screenshot focuses on the 'Landuse Folder:' section. It shows the 'Choose File' button, the text 'No file chosen', and the 'Upload' button. A green checkmark is now visible next to the 'Upload' button, indicating a successful upload.

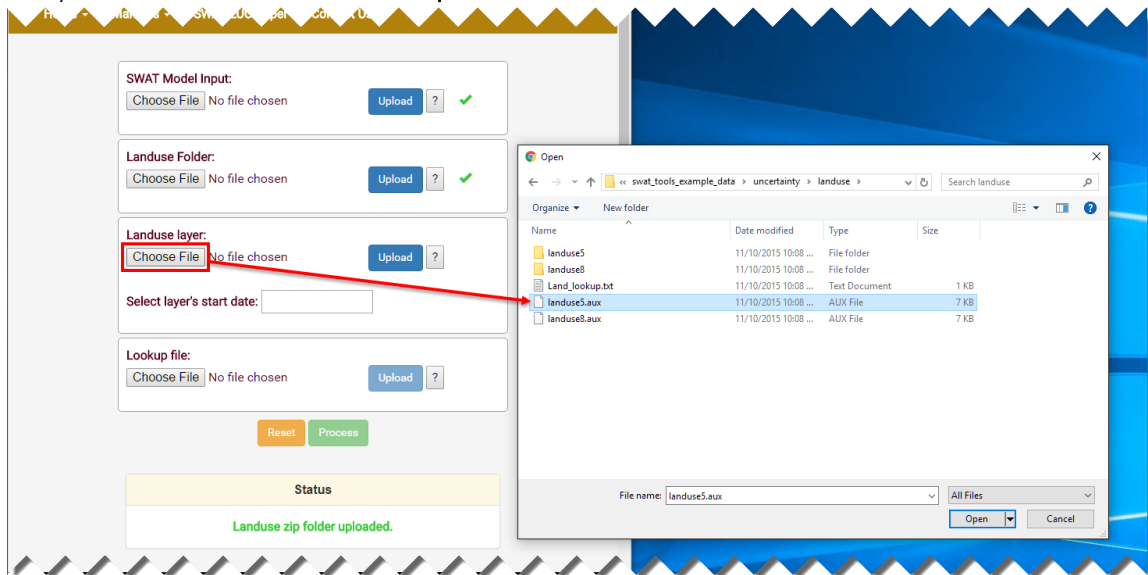

The **Status** frame located at the bottom of the page will be updated with relevant information as you use the tool. If there had been a problem with the landuse data, a message would have appeared in the **Status** frame informing you of the issue.

The screenshot shows a 'Status' frame with a yellow header and a white body. The text 'Landuse zip folder uploaded.' is displayed in green, indicating a successful upload.

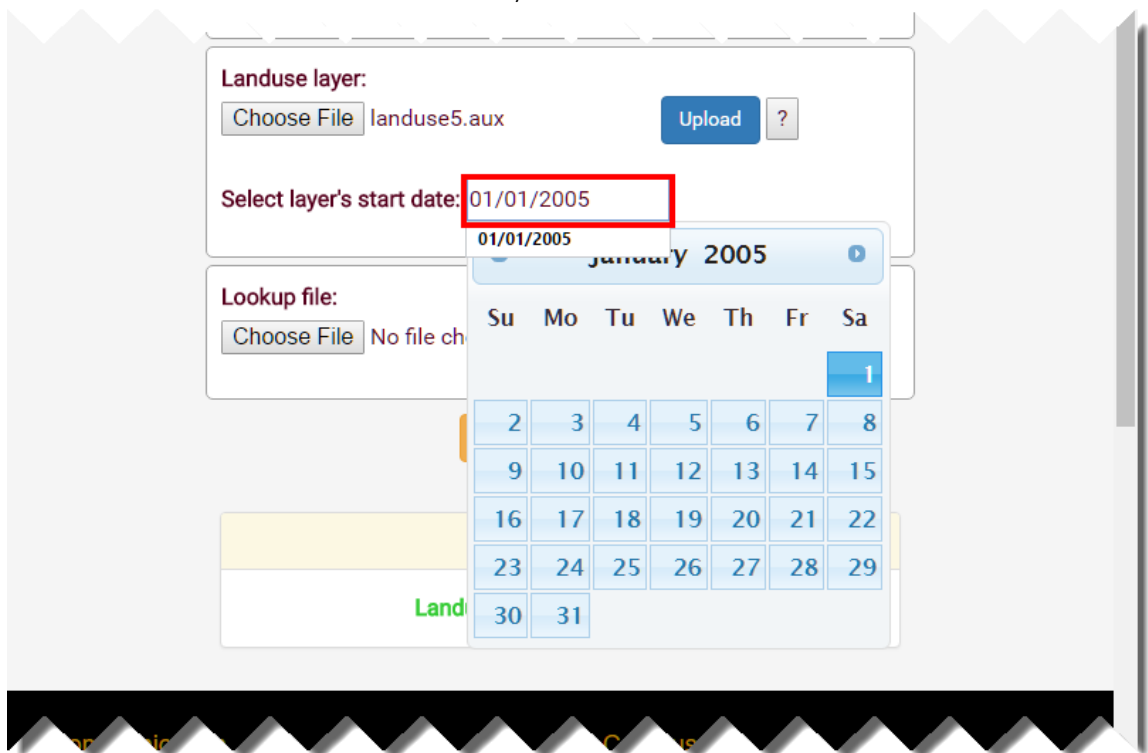

Step 3 – Landuse layer

- Click the **Choose File** button in the **Landuse layer** section and navigate to the directory containing your landuse data. Either double-click the “.aux” file associated with the landuse layer you wish to

analyze or left-click it and click the **Open** button.

- Next enter the start date for the landuse layer.

- After selecting the landuse layer's ".aux" file and entering a start date, click the **Upload** button. A green checkmark will appear when the upload has successfully finished.

Landuse layer:

No file chosen

Select layer's start date:

The **Status** frame located at the bottom of the page will be updated with relevant information as you use the tool. If there had been a problem with the landuse data, a message would have appeared in the **Status** frame informing you of the issue.

Status

Landuse layers selected.

Step 4 – Lookup file

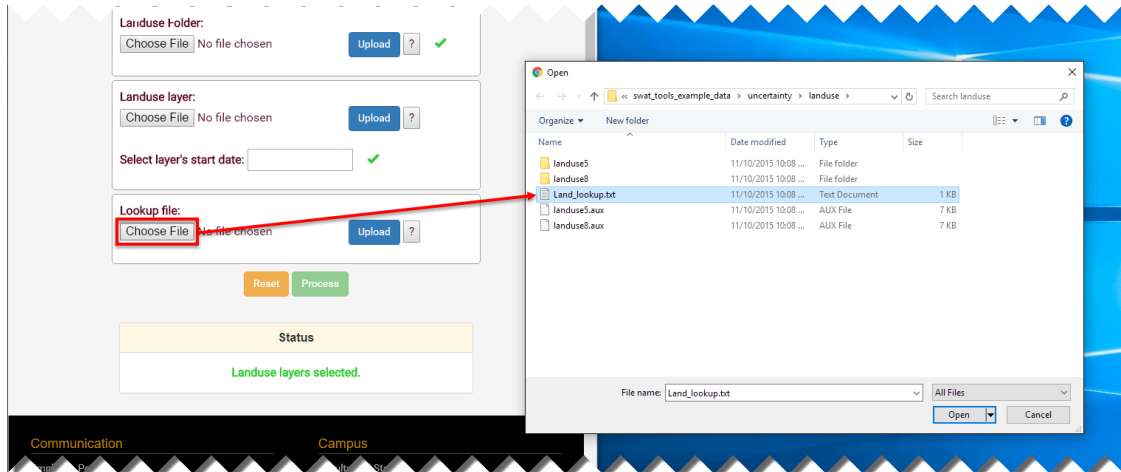

- The lookup file should be a text file that follows a specific format. It should have the following line as its header: **"Value", "Landuse"**

The subsequent rows should contain an integer value and landuse description used in your SWAT model separated by a comma. For example, "41,WATR" or "100,FRST" – an example lookup file can be seen in the below screenshot:

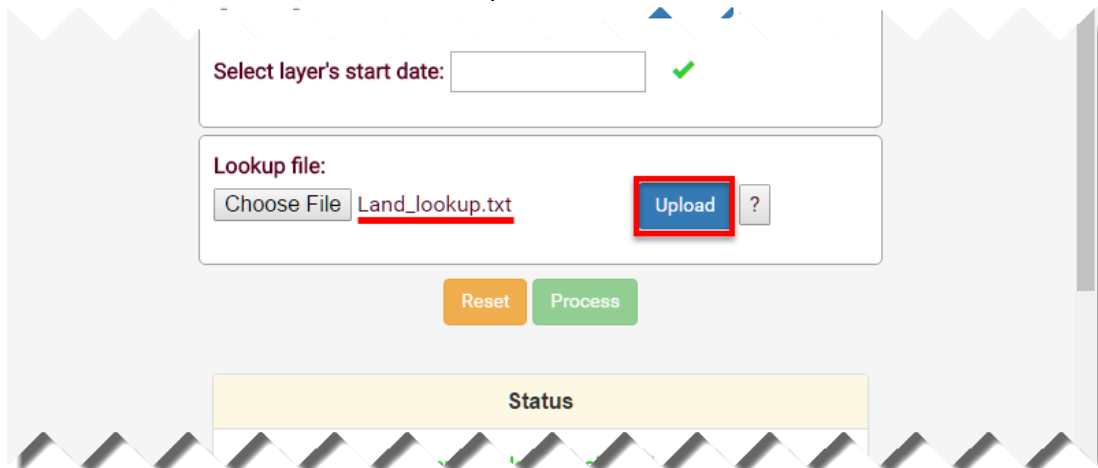

```

Land_lookup.txt - Notepad
File Edit Format View Help
"Value", "Landuse"
11, URLD
13, URBN
31, AGRL
41, WATR
51, AGRL
100, FRST
201, SOYB
202, RICE
203, COTP
204, WWHT
205, CORN
209, BERM
210, BROS
  
```

- Once your lookup file is in the correct format, click the **Choose File** button in the **Lookup File** section to start the process of uploading the lookup file. Navigate to the location of your lookup file and double-click it, or click it once and click the **Open** button.

- After selecting the lookup file, click the **Upload** button.

- The **Status** frame will be updated to indicate the file was successfully uploaded.

- When the lookup file finishes uploading, a new button will appear in the **Lookup file** section named **Update Errors**. Click the **Update Errors** button to expand the view.

6. Clicking the button will reveal a new form containing an entry for each of the landuse codes provided in the lookup file. You will be able to set an error (%) and number of realizations for each landuse code. Clicking the **Update Errors** button will cause the form to close. The next few steps will show how to use this form.

Lookup file:

No file chosen

☒

^ Update Errors

For the landuses you are interested in updating, set the Error (%) value to the categorical error percentage. In the No. Realizations column, provide the number of realizations. Once you have finished making your adjustments click the Update button.

Landuse	Error (%)	No. Realizations
11:	<input type="text" value="0"/>	<input type="text" value="0"/>
13:	<input type="text" value="0"/>	<input type="text" value="0"/>
31:	<input type="text" value="0"/>	<input type="text" value="0"/>
41:	<input type="text" value="0"/>	<input type="text" value="0"/>
51:	<input type="text" value="0"/>	<input type="text" value="0"/>
100:	<input type="text" value="0"/>	<input type="text" value="0"/>
201:	<input type="text" value="0"/>	<input type="text" value="0"/>
202:	<input type="text" value="0"/>	<input type="text" value="0"/>
203:	<input type="text" value="0"/>	<input type="text" value="0"/>
204:	<input type="text" value="0"/>	<input type="text" value="0"/>
205:	<input type="text" value="0"/>	<input type="text" value="0"/>
209:	<input type="text" value="0"/>	<input type="text" value="0"/>
210:	<input type="text" value="0"/>	<input type="text" value="0"/>

- Set the error and number of realization for the landuse codes you are interested in modifying. For the codes you do not wish to modify, simply leave them on their default values (0, 0). After making your adjustments, click the **Update** button located at the bottom of the form.

Lookup file:

No file chosen

☒

^ **Update Errors**

For the landuses you are interested in updating, set the Error (%) value to the categorical error percentage. In the No. Realizations column, provide the number of realizations. Once you have finished making your adjustments click the Update button.

Landuse	Error (%)	No. Realizations
11:	0 ▾	0 ▾
13:	4 ▾	2 ▾
31:	0 ▾	0 ▾
41:	0 ▾	0 ▾
51:	0 ▾	0 ▾
100:	6 ▾	3 ▾
201:	0 ▾	0 ▾
202:	0 ▾	0 ▾
203:	0 ▾	0 ▾
204:	0 ▾	0 ▾
205:	0 ▾	0 ▾
209:	0 ▾	0 ▾
210:	0 ▾	0 ▾

- The **Status** frame will be updated to indicate your errors and realizations have been selected.

Status

Errors and realizations selected.

Step 5 – Process

- Once all of the inputs have been entered, click the **Process** button to submit the job request.

Lookup file:
Choose File No file chosen
Upload ? ✓

▼ Update Errors

Reset
Process

Status

Errors and realizations selected.

- Once the job has been successfully added to the queue, the **Status** frame will update to the following message:

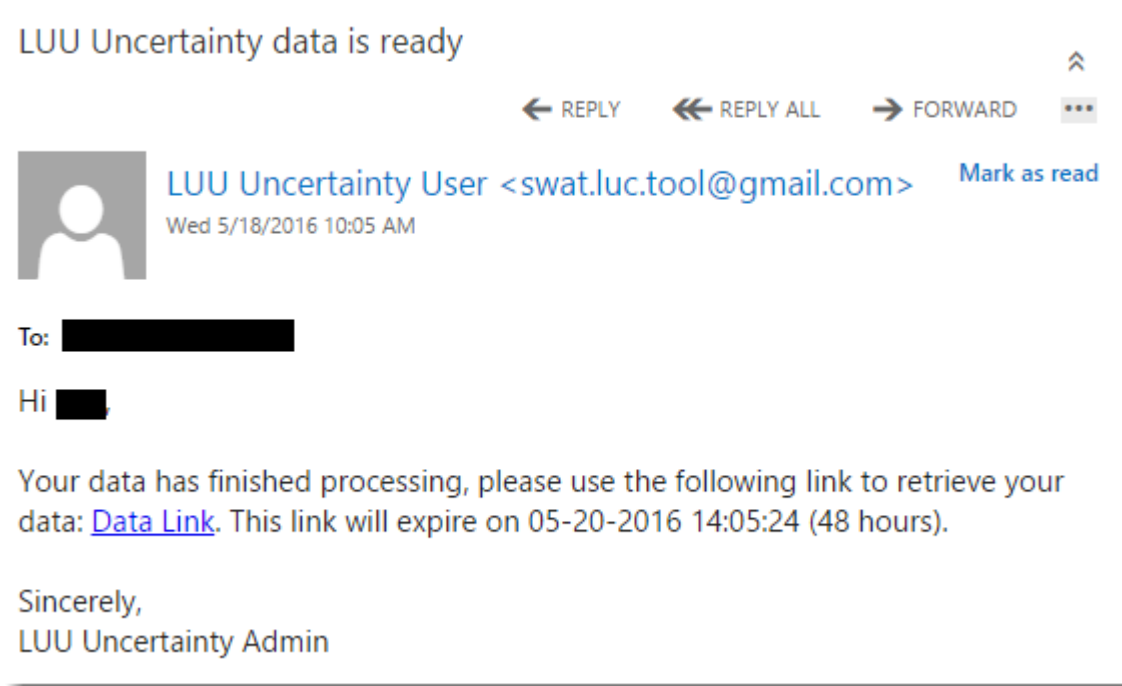

Status

Job successfully added to queue. You will receive an email
 with a link to your files once the processing has completed.

At this point you can either click the **Reset** button (clears the form) and start uploading a new dataset or leave the page. When the job has finished running, an email will be sent to you containing a link to your results.

Step 7 – Downloading your data

1. You will receive an email when your data is ready for download. It will look similar to the below screenshot:

2. As indicated by the email message, you will have 48 hours to download your results before the results are permanently deleted. Click the “Data Link” to start the download. If you are not signed in to the site, you will be asked to do so before the download begins.
